

Claude Code or Go Home

How instacar's Product Team Ships with AI

The Cools

Claude Code

Terminal-first, composable
1M token context window

We're Using

Antigravity

Visual IDE, agent-first
Browser subagent via Google DeepMind

Two AI tools. Different strengths. Both in your workflow.

Claude Code: Terminal + VS Code Extension

Your codebase is the context. The terminal is the interface.

Zero context switching

Works directly inside VS Code — your files, tickets, and design system are already there

Full file awareness

Reads what's relevant — not just what you paste

The extension is the game changer

Inline chat + complete codebase context in one place

Antigravity: Built for PMs and Designers

Claude Code's visual partner.
Agent-first, no terminal needed.

Visual task execution

Fills forms, navigates
tools, tests UI visually

PM without the terminal

Do visual work
without touching the
command line

Parallel agents

Claude Code thinks.
Antigravity acts.

The Knowledge System: LLM Wiki

Knowledge compounds. You stop researching the same thing twice.

raw/

Immutable source documents — never modified. Your single source of truth.

wiki/

Compressed, interlinked knowledge maintained by Claude. Gets smarter over time.

Outputs

Tickets, wireframes, decisions, daily logs
— artifacts your team actually uses.

How Ingestion Works

Add Source

Claude
Summarizes

Discuss and
Align

Create Wiki

Update Index

Feed it once. Reference it forever.

Context Scoping

The right context every time. Not all context every time.

Why it matters

Claude only reads what's relevant per context — sharper answers, less noise, cheaper to run.

Scoping prevents context bleed and keeps outputs focused on the right domain.

raw/

Immutable source documents — never modified. Your single source of truth.

wiki/

Claude-maintained pages + index.md + log.md

log/

Daily summaries in DD-MM-YYYY.md format

claude/

Skills, PM commands and reusable frameworks

Linear + MCP: The Connection

MCP turns Linear into a tool Claude can actually use.

Direct integration

Model Context Protocol connects Claude Code straight to Linear — no copy-pasting

Bidirectional context

Wiki → ticket and ticket → wiki. Full context flows both ways automatically

No tab switching

Read, create, and update tickets without ever leaving your editor

PM Skills Built In

Frameworks you know — now executable in one command.

UI UX Pro Max

67 UI styles, 161 design reasoning rules.
Installed via Claude Code marketplace.

Awesome DESIGN.md

Real brand design systems (Linear, Figma, Stripe). Drop in project, Claude generates matching UI.

claude/skills/

PM commands folder — all skills live here, loaded per context

The Ticket Template

Every ticket is a complete document, not a placeholder.

Claude Code reads this on every /create-ticket call. No briefing needed.

wiki/ticket-template.md

Description → Current State → What to Do → Acceptance Criteria → FigJam →
Figma → Metrics → Notes

Live Example: INS-4808

From a vague ask to a fully specified ticket.

This is what wiki context + PM skills + ticket template produces together.

The ask

"We need calendar links in the ARM service appointment email"

The output

- Google Calendar URL with all dynamic parameters
- Apple .ics spec generated server-side
- Data table: which field maps to which ARM field
- UTC offset logic for Greek timezone
- Edge case: end time defaults to start + 1 hour
- URL over attachment — avoids email client rendering issues
- Two GitHub PRs linked, now in QA

From Figma to Machine-Readable

One export. Every AI-generated UI respects your design system from day one.

The design system becomes an instruction manual for AI.

Export Tokens

Export design tokens from Figma

Structure File

Organize tokens into DESIGN.md

Place in Root

Drop Design.md into project root

AI Reads guide

Claude reads DESIGN.md before UI

What DESIGN.md Contains

Everything a designer knows — in a file Claude can read.

Color palette

Semantic naming: primary, surface, error, and more

Typography hierarchy

H1 → body → caption — every level defined

Component specs

Buttons, inputs, modals, cards — full styling rules

Layout & spacing

Shadow, depth, responsive behavior, and spacing system

Prompt → High-Fidelity Wireframe

First draft in minutes. Designer reviews intent, not a blank canvas.

Natural language prompt

Describe the feature referencing your design context

Claude reads DESIGN.md

Colors, type, spacing — all applied before output

On-brand wireframe

Matches instafleet visual language exactly

```
"Design the ARM ticket confirmation email with Add to Calendar buttons  
following our design system"
```

The Full Stack

Everything we're working with, in one view.

Layer	Tool	What it does
Agentic IDE	Claude Code — terminal + VS Code extension	Code, context, tickets
Visual IDE	Antigravity	Multi-agent, no terminal needed
Tickets	Linear + MCP	Read, create, update from Claude
PM Frameworks	/user-story · /prd-development · /jobs-to-be-done	Structured outputs on demand
Design	Figma tokens → DESIGN.md → wireframes	On-brand UI from a prompt
Knowledge	raw/ → wiki/ → daily logs	Compounding institutional memory

How Knowledge Compounds

The system gets smarter the more you use it.

Month 1

First ingests, first tickets,
first design outputs

Month 2

Patterns emerge, wiki cross-
links form, no repeated
research

Month 3

New team member
onboards using the wiki in a
single session

Month 6

Every decision has context.
Every ask has precedent.

Adoption Path

Four phases. Start small. Build momentum.

Install

Claude Code + VS Code extension. Set up raw/ + wiki/ folder structure.

Ingest

Add your first project source. Run your first ticket using a PM command.

Design

Extract Figma tokens. Create DESIGN.md. Generate your first wireframe.

Scale

Add Antigravity for visual agentic work. Expand PM skills library.

"The best knowledge system
is the one that makes your
next decision faster than
your last."

One session is enough
to feel the difference.
The compounding
starts immediately.
